

Steps to install and run the web application:-

1. Install XAMPP

If not already installed:

- Download from <https://www.apachefriends.org>.
 - Install and open the XAMPP Control Panel.
 - Start **Apache** and **MySQL**.
-

2. Place PHP Project in htdocs

- Go to C:\xampp\htdocs.
 - Paste your PHP project folder there.
Example: C:\xampp\htdocs\myproject
-

3. Import the SQL File into phpMyAdmin

1. Open your browser and go to:
`http://localhost/phpmyadmin`
 2. Click **Databases** → Create a **new database** (e.g., mydb).
 3. After creation, click the database name.
 4. Click the **Import** tab.
 5. Choose your .sql file and click **Go**.
-

4. Configure Database Connection in Your PHP Project

Edit your PHP file that connects to the database, usually named config.php, db.php, or similar. Make sure it matches your database info:

php

```
$host = "localhost";
```

```
$user = "root";
```

```
$password = ""; // default is empty for XAMPP
```

```
$database = "mydb";
```

```
$conn = new mysqli($host, $user, $password, $database);
```

```
if ($conn->connect_error) {  
    die("Connection failed: " . $conn->connect_error);  
}
```

5. Run the Project

- Open browser and go to:

`http://localhost/myproject`

- Adjust the URL based on your folder name in htdocs.
-

6. Troubleshooting Tips

- Check PHP error messages for missing files or syntax issues.
- If using `.htaccess` and it's not working, ensure **mod_rewrite** is enabled in Apache (`httpd.conf`).
- If project uses a framework (Laravel, CodeIgniter, etc.), let me know — steps differ slightly.
